Product Description

1.2 Liter Halva Tin Box JB

1.2 Liter Halva Tin Box JB is a product name in the JB metal packaging mold family, which offers different packing volumes for halva producers. Kontensan presents this range within Halva, Tahini, Molasses and Jam Tin Cans, and Pails under Food Tin & Metal Packaging. Buyers comparing halva tin manufacturers should not consider nominal capacity alone. They also need to review the finished container's height, sheet metal thickness, inner lacquer and lid design. The JB mold capacity range includes 1.2 liters. However, the supplied datasheet provides detailed finished-product specifications only for the 500 ml L301 halva box. The verified features of L301 should not be presented as the exact specifications of a larger finished container.

Halva Tin Mold Dimensions and Capacity Range

The JB mold family has a listed diameter of 120 mm, a reference height of 36 mm and a capacity range from 0.4 to 3 liters. Available sheet metal thickness options are 0.24 mm and 0.25 mm. These options do not mean that every finished version has the same height or thickness. The documented L301 product holds 500 ml, measures 49 mm high and uses 0.24 mm sheet metal. The mold's 36 mm reference height is different from the finished product's 49 mm height. Buyers should use actual finished dimensions when setting up filling equipment, choosing shipping cartons and planning storage. For a requested 1.2-liter halva box, the finished product code, production availability and exact measurements must be confirmed separately.

Gold Lacquered Surfaces and Slip-on Lid

L301 has gold lacquer on both its inner and outer surfaces. The finished product uses a welded side-seam body and a slip-on lid. Its datasheet does not list a separate opening, carrying handle, seam coating or decorative rib. The wider JB family includes other inner coatings, exterior finishes, offset printing and seam coating options, but these are not all confirmed standard features of L301. When choosing empty halva packaging, buyers should check whether the inner coating is suitable for the halva's oil content, filling temperature and planned shelf life. They should also confirm that the slip-on lid works for the intended closing, storage and transport conditions. Gold lacquer alone does not prove suitability for every food filling process.

Wholesale Halva Tin Packaging and Order Requirements

Suppliers of empty metal halva boxes should be compared using the same finished-product requirements. For L301, these include 500 ml capacity, 49 mm height, 0.24 mm sheet metal, gold lacquer inside and outside, and a slip-on lid. Kontensan's metal offset printing facilities may support custom branded packaging in suitable production configurations, but printing is not a documented standard feature of L301. Businesses buying wholesale halva tins in a 1.2-liter size should confirm that the specific finished version is available and review its technical specifications. A shared product category does not prove that the same container suits tahini, molasses or jam. Coating compatibility and filling requirements must be checked separately for each food. Clear specifications also help buyers compare quotations accurately.

Frequently Asked Questions - FAQ

Is a finished 1.2-liter JB halva box confirmed in the datasheet?

The JB mold family covers 0.4 to 3 liters, but the documented finished product is the 500 ml L301. Exact 1.2-liter specifications need separate confirmation.

What are the capacity and height of L301?

L301 holds 500 ml, measures 49 mm high and uses 0.24 mm sheet metal.

Which lid and coating does L301 use?

L301 has a slip-on lid and a welded side-seam body, with gold lacquer inside and outside. No handle or separate opening is listed.
