Product Description

1 Liter Halva Tin Box PA

1 Liter Halva Tin Box PA is a one-liter metal packaging option for halva producers. Kontensan offers this product within Halva, Tahini, Molasses and Jam Tin Cans, and Pails under Food Tin & Metal Packaging. When choosing empty halva tins, buyers should consider more than capacity. Metal thickness, finished height, slip-on lid design and inner coating all matter. The finished one-liter version within the PA mold family is identified as L373. Its documented specifications help buyers prepare accurate requirements for wholesale halva packaging orders. Comparing containers on the same technical basis can also reduce confusion between different product families.

Dimensions and Thickness of the One-Liter Halva Tin

The PA mold datasheet lists a diameter of 175 mm, a reference height of 38 mm and a capacity range from 1 to 7 liters. The mold family includes sheet metal thickness options of 0.24 mm and 0.25 mm. However, the finished L373 model holds one liter, measures 50 mm high and uses 0.25 mm sheet metal. The 38 mm mold reference should not be confused with the finished box's 50 mm height. Filling equipment, shipping cartons and stacking plans should use the actual finished dimensions. When comparing halva tin manufacturers, buyers should also remember that equal capacity does not always mean equal body dimensions or metal thickness.

Welded Side Seam, Slip-on Lid and Gold Lacquer

L373 uses a welded side-seam body and a slip-on lid. It has gold lacquer on both the inner and outer surfaces. The finished product record lists no separate opening, carrying handle, seam coating or decorative ribbing. The wider PA mold family offers alternative inner and outer lacquers and several seam coating options, but these are not confirmed standard features of L373. Buyers should check food-contact suitability based on the halva's oil content, filling temperature and expected storage period. They should also confirm that the slip-on lid is suitable for the planned closing process and transport conditions before placing an order.

Wholesale Halva Tins and Custom Printing

When comparing empty halva tin manufacturers, buyers should specify the L373 code, one-liter capacity, 0.25 mm metal, gold lacquer and slip-on lid in every quotation. Kontensan's metal offset printing facilities may support branded packaging in suitable production configurations, but offset printing is not a documented standard feature of L373. Wholesale buyers should confirm printing requirements, order quantities and delivery terms separately. The category name alone does not establish that this container is also suitable for tahini, molasses or jam. Inner coating and filling compatibility must be reviewed for each food. This helps prevent incorrect product selection based only on a broad packaging category.

Frequently Asked Questions - FAQ

What are the height and metal thickness of the one-liter PA halva tin?

The finished L373 model is 50 mm high and uses 0.25 mm sheet metal. The PA mold's 38 mm value is only a reference height.

Which lid and surface coating does L373 use?

L373 has a slip-on lid, a welded side-seam body and gold lacquer on both its inner and outer surfaces.

Does L373 include a handle or decorative rib?

No. The finished L373 product record lists neither a carrying handle nor decorative ribbing.
