Product Description

1 Liter Slip-lid Halva Tin Box NA

1 Liter Slip-lid Halva Tin Box NA is a one-liter metal packaging solution with a folded-seam body and a slip-on lid for halva products. Kontensan offers this model within Halva, Tahini, Molasses and Jam Tin Cans, and Pails under Food Tin & Metal Packaging. The finished one-liter version in this mold family is identified as L365. For halva producers, packaging choice depends on more than capacity. Actual body height, sheet metal thickness, inner lacquer and lid performance all matter. The folded seam and decorative ribbing are among the confirmed features that distinguish this model. When placing wholesale halva packaging orders, specifying the finished product code helps prevent confusion between different capacities and body designs.

Dimensions and Metal Thickness of the Halva Tin

The NA mold family lists a diameter of 140 mm, a reference height of 38 mm and a capacity range from 0.6 to 3.7 liters. It offers sheet metal thickness options of 0.22 mm, 0.24 mm and 0.25 mm. However, the finished L365 version holds one liter, measures 145 mm high and uses 0.24 mm sheet metal. This distinction is important: 38 mm is a reference measurement for the mold family, while 145 mm is the height of this finished product. Businesses should use verified finished dimensions when planning storage shelves, cartons, filling lines and shipping. When comparing empty halva tin manufacturers, buyers should also consider that containers with the same nominal capacity may have different body dimensions and logistics requirements.

Slip-on Lid, Gold Lacquer and Decorative Ribbing

L365 has gold lacquer on both the inner and outer surfaces. The body uses a folded seam and closes with a slip-on lid. The finished product includes decorative ribbing, while no separate opening, carrying handle or seam coating is listed. These details help distinguish the container from other metal halva boxes of similar capacity. The wider NA mold family offers additional inner and outer coatings and offset printing options, but they are not all standard features of L365. Decorative ribbing can influence appearance, yet it does not guarantee food-contact safety or leak resistance. Buyers should confirm the inner coating and closure performance based on the halva's oil content, filling temperature and expected shelf life before placing an order.

Wholesale Halva Tin Manufacturing and Branded Packaging

When comparing halva tin manufacturers or suppliers of empty metal halva boxes, buyers should use the same specification: L365 product code, one-liter capacity, 145 mm finished height, 0.24 mm metal, gold lacquer inside and outside, and a slip-on lid. Kontensan's metal offset printing facilities may support branded packaging in suitable production configurations, but custom printing is not a confirmed standard feature of L365. Wholesale buyers should agree on order quantity, printing requirements, filling method and delivery conditions. Businesses seeking empty tahini tins, molasses tins or jam packaging should not assume that this container suits those foods simply because they appear in the same category. Packaging compatibility must be checked for each food's ingredients and filling conditions.

Frequently Asked Questions - FAQ

What is the finished height of the one-liter folded-seam halva box?

The finished L365 version is 145 mm high. The NA mold family's 38 mm figure is a reference measurement, not the finished product height.

Which lid and surface coating does the halva box use?

L365 has a slip-on lid, gold lacquer inside and outside, a folded-seam body and decorative ribbing.

Does the one-liter halva box include a handle or separate opening?

No. The L365 finished-product entry lists neither a carrying handle nor a separate opening.
